

To retip or not to retip?

That IS the question!

- Retipped instruments just don't hold an edge...they are more difficult to sharpen and need to be sharpened more often.
- Companies that retip do not use the same high-grade steel or the specialized heat treating that we use in our "Continental" curettes and scalers.
- When instruments are retipped, they are often unbalanced and out of alignment.
- Many retipped instruments will experience premature failure and are more susceptible to corrosion problems.
- Retipped instruments are more susceptible to handles cracking and tips separating from the handles.

For a few dollars more than retipping, you could be using a brand new instrument.

Choose "CONTINENTAL"
curettes and scalers!
